Abstract of JP2079193

PURPOSE: To make it possible to transfer a part of a deposited amount to a card and receive the balance as a change by providing a card section which can read and write the data of a prepaid card.

CONSTITUTION: A customer deposits an amount to a paper money receiving and delivering section 3 or coin receiving and delivering section 4 after selecting the money depositing mode through a selection button 9 and, when the customer wants to increase the remaining amount of the card, the customer selects a desired commodity after inputting the amount to be transferred to the card from ten keys 8 and unit keys 10. Then, after the designated amount is written on the prepaid card in a card section 2, the amount of the desired commodity is deducted and the balance is returned from the sections 3 and 4 as a change. When nothing is transferred to the card, the amount of the commodity is deducted from the sum of the remaining amount of the card and deposited amount and the balance is returned as a change when the change is selected from the selection button 9. Therefore, the remaining amount of the prepaid card can be increased when rewriting can be performed on the card in such way.
